

CLIMATE EMERGENCY RESPONSE

From a flood report to coordinated help—in minutes, not fragmented handoffs.

One response network for affected residents, community capacity, and accountable municipal coordination.

Working end-to-end application

The people who need help and the people who can help are visible in different systems.

Flood response breaks at the coordination layer: alerts, resident needs, volunteer capacity, shelter space, routes, and authorizations arrive separately.

AFFECTED RESIDENT "Where is safe—and is help coming?" • Medical and mobility needs • Transport and accommodation • Location-specific guidance	COMMUNITY CAPACITY "Who needs what I can provide?" • Skills and travel radius • Available shelter spaces • Verification and status	COORDINATOR "What is true, urgent, and authorized?" • Conflicting reports • Multiple resource matches • Audit and accountability
--	---	---

AEGIS turns a request into a verified, multi-resource response.

1

Request

Resident shares exact location, needs, and vulnerability factors.

2

Assess

Signals are grouped; urgency, confidence, and risk stay distinct.

3

Match

Verified volunteers, shelters, and response capabilities are combined.

4

Authorize

A human confirms evidence, staging sites, route, and warning content.

5

Track

Residents see status; every recommendation and decision is recorded.

Specialized agents reduce noise; humans retain consequential authority.

The map and response are generated from live services and user-supplied facts—not a fixed city.

AEGIS never turns uncertainty into authority.

COMMUNITY	Raw report stays attributed and can remain unverified.
AI	Recommendation records confidence, evidence, and unresolved claims.
HUMAN	Coordinator verifies incident, resources, route, and warning content.
AUDIT	Every change is timestamped and separated by actor type.

Confidence ≠ severity

Suggested site ≠ confirmed availability

Community report ≠ official alert

Warning approval ≠ delivery without a provider

THE DEMONSTRATION

Watch one resident request become an accountable response.

Submit a need. Offer community capacity. Verify the evidence. Select multiple staging sites. Match resources. Approve the plan.

What AEGIS proves today

A city-independent, role-based response network can connect live location services, agentic assessment, community capacity, and human authorization in one coherent flow.
